

# Can You Spot The Fakes?

Some of these images are real people, but others are AI-generated deepfakes. Can you tell the difference? [Click each one to see if you're right.](#)

## Why You Need Strong AI To Fight AI-Generated Fraud

Traditional verification methods struggle to keep up with sophisticated new threats. And deepfake images and videos, manipulated documents, and fabricated identities can easily trip up human operators with increasingly subtle changes.

Government agencies can leverage IDVerse®, an AI-powered and automated document authentication and biometric verification solution, now part of LexisNexis® Risk Solutions, to deliver the smooth and secure verification and authentication that today's consumers demand.

# Which Documents Are Real?

Fraudsters create deepfake identities that incorporate advanced features to mimic every detail of legitimate documents and photos, making them virtually undetectable to the human eye. The IDVerse solution leverages AI and advanced face matching capabilities for automated authentication of ID documents and verification of ID holders' identities.
